Acknowledgement

I would like to express my most sincere gratitude to my respected Computer Science teacher, **Sir Apar Adhikari**, for his unwavering support and for granting me the opportunity to demonstrate the HTML expertise I have cultivated throughout this academic session. His mentorship has been a vital catalyst for my growth, providing the technical foundation and the creative encouragement necessary to bring this project to fruition. His ability to simplify complex concepts has truly inspired my passion for web development and software design.

I am equally indebted to **Laligurans Batika Secondary School** for providing an astounding learning space that transcends traditional education. The institution fosters an environment that excels a student's capability to grasp technical subjects like Computer Science with absolute accuracy and intellectual rigor. I am particularly grateful for the school's dedication to academic freedom, which allows students the liberty to explore their interests deeply and develop their skills within a modern, forward-thinking atmosphere.

Finally, I wish to acknowledge the school administration and my fellow students for cultivating a culture of excellence and mutual support. The resources and opportunities provided by Laligurans Batika Secondary School have not only enhanced my academic performance but have also equipped me with the confidence to tackle future challenges in the ever-evolving world of technology. This project is a direct reflection of the high standards of learning and the exceptional guidance I have been privileged to receive.

Introduction

The primary objective of this project, as assigned by **Sir Apar Adhikari**, was to conceptualize and develop a functional website based on an independently selected theme. This initiative was designed to test our ability to bridge the gap between abstract project planning and technical execution using the HTML foundations established during this academic session. Following the formal submission and approval of my chosen topic, I transitioned into the design and development phase of the **Agricultural Equipment Store**.

The core philosophy behind the Agricultural Equipment Store is to streamline the modernization of traditional farming methods. In an era where efficiency is paramount, this platform serves as a digital bridge between essential hardware and the agricultural workforce. The website is specifically engineered to provide farmers and agricultural workers with a seamless, user-friendly interface to procure vital tools—ranging from fundamental hand tools like **Iron Shovels** and **Iron Buckets** to heavy-duty machinery such as **Tractors**.

By centralizing the availability of these resources, the project aims to address the logistical challenges often faced in rural or developing agricultural sectors. The ultimate goal of this digital storefront is to empower the farming community by providing easy access to equipment that makes their daily labor both faster and less physically taxing. This file serves as a comprehensive overview of the website's architecture, the logic behind its development, and its potential impact on making the "agricultural journey" a more efficient and productive endeavor.

Objectives

The project was made not only with the incentive of getting better grades in the academic field, it is also empowered by the vision to create something with practical utility in real life scenarios. A few main objectives of the project are enlisted below:

1. To get academic grades in the subject of Computer Science

The creation of the project was more leaned towards an academic standpoint as it was created for that reason.

2. To get a conceptual and practical learning of HTML, CSS, JS

This project, since it was made on the mentioned languages require me to gain an understading of the languages.

3. To be able to use my learning of the above mentioned languages in a practical manner

The project also had the incentive of helping me practice these languages by simply using it in an practical case.

4. To create a fundamental idea on how an Agricultural store could be set up

The project also has the objectivce of creating an understanding of an agricultuiral website and how it is supposed to work.

Features

The website is built with many features onboard. The primary features of the website are enlisted below:

1. Good set of equipments

The website in total holds 6 different equipments placed in a 3x2 grid.

2. Great styling with CSS

The Website contains a great work in CSS which helps the website be more intuitive and better looking for the user/consumer.

3. Discord Webhook

The website uses Discord Webhook placed in a server to keep track of orders made by the users, it allows for a more realistic buying experience.

4. Lightweight

The website is completely static and has no backend requirement making it insanely lightweight.

5. Use of JS for logic

The website uses javascript to manage the placing order and the webhook order storing system.

Methodology

The website is completely based on **HTML**, **CSS**, and **JS** and was programmed on Microsoft Visual Studio Code. The website follows a multiframe system to make it easier for the user to read the source code. AI tools like **Gemini** and **Google Search AI** were used for different parts of the website to fill the gap in my skillset which made the development of the website quicker and faster. Different parts were made solely by me but in the case of bugs and confusion, these AI tools were used. Though the development was dependent on these AI's, the project was not solely curated by an AI and was also a creation of my intellect.

For images, tools like **Google Search** was used and prices were completely non-statistical and completely eyeballed by me, the developer. For the feature of discord webhook, the free API that discord provides was used. For the preview of the website, a **Visual Studio Code** extension by the name **Live Server** was used as it made it easier to preview the website on the time of development. **Chrome Browser** by **Google** was used as the preview browser, but the website should run as good in other browsers too.

Limitations

The website though its high onboard feature set is filled with limitations. A few limitations are given below:

1. Lack of Equipments

Since the site only has a set of 6 equipments, it doesnt cover every equipment that is required for a agricultural firm.

2. Lack of Backend

The website is solely frontend based, meaning it has no backend server and sata storage system.

3. Staticness

The website is completely static, meaning it doesnt change over time unless the sourcecode is changed. This adds a limitation for future equipments as it requires change in the source code.

4. Lack of search system

A way of searching for the required item doesn't exist in the website, part of the reason is the lack of equipment, but if the website were to ever grow in term of equipments, it wouldnt require a search bar.

Conclusion

This website was mostly made for the sake of academic grade though the **Objectives** page says otherwise, this is a personal project made for submission with most of the parts of the website heavily relying on the courses instruction. The website adds many parts taught in the course with some extra additives to make the website better.

It was fun working on this project and it helped me learn a lot about web development in general. The website is currently online on

<https://porkfrnd.github.io/Agricultural-equipment-store/>

It has been set online with the help of Github. The source code of the website can also be viewed on github on

<https://porkfrnd.github.com/Agricultural-equipment-store/>
